

# B-Y WATER DISTRICT

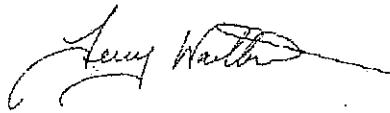

PO Box 248 • Tabor, SD 57063-0248  
605-463-2531 • 1-800-286-3654

April 1, 2019

Dear Consumer:

This information is in reference to the Safe Drinking Water Act Consumer Confidence Report which requires that B-Y Water District provide a copy of its annual quality report to you. A copy of the annual quality report is included in this brochure for your review.

Respectively yours,

Terry Wootton, General Manager  
B-Y Water District

## 2018 Drinking Water Report

*Last year, the B-Y Water District monitored your drinking water for possible contaminants. This brochure is a snapshot of the quality of the water that we provided last year. Included are details about where your water comes from, what it contains, and how it compares to Environmental Protection Agency (EPA) and state standards. We are committed to providing you with information because informed customers are our best allies.*

### Water Source

We serve more than 4,979 hookups (which include the cities and rural water districts of Mission Hill, Volin, Irene, Utica, Avon, Lesterville, Tyndall, Tabor, Scotland, Menno, Parkston, Freeman, Mitchell, T-M Rural Water, and Hanson Rural Water) an average of 6,307,632 gallons of water per day. We get our water from surface water sources. The state has performed an assessment of our source water and they have determined that the relative susceptibility rating for the B-Y Water District public water supply system is high.

For more information about your water and information on opportunities to participate in public meetings, call (605) 463-2531 and ask for Terry Wootton.

### Additional Information

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

*Microbial contaminants*, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

*Inorganic contaminants*, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

*Pesticides and herbicides*, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.

*Organic chemical contaminants*, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants can be obtained by calling the Environment Protection Agency's Safe Drinking Water Hotline (800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The B-Y Water District public water supply system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>

## Detected Contaminants

The attached table lists all the drinking water contaminants that we detected during the 2018 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 - December 31, 2018. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, is more than one year old.

### 2018 Table of Detected Contaminants for B-Y Water District (EPA ID 0865)

Terms and abbreviations used in this table:

- \* *Maximum Contaminants Level Goal (MCLG): the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.*
- \* *Maximum Contaminant Level (MCL): the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.*
- \* *Action Level (AL): the concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow. For Lead and Copper, 90% of the samples must be below the AL.*
- \* *Treatment Technique (Tt): A required process intended to reduce the level of a contaminant in drinking water. For turbidity, 95% of samples must be less than 0.3 NTU.*

Units:

- \* *MFL: million fibers per liter*
- \* *mrem/year: millirems per year (a measure of radiation absorbed by the body)*
- \* *NTU: Nephelometric Turbidity Units*
- \* *pCi/l: picocuries per liter (a measure of radioactivity)*
- \* *ppm: parts per million, or milligrams per liter (mg/l)*
- \* *ppb: parts per billion, or micrograms per liter (ug/l)*
- \* *ppt: parts per trillion, or nanograms per liter*
- \* *ppq: parts per quadrillion, or picograms per liter*
- \* *pspm: positive samples per month*

Substance	90% Level	Test Sites > Action Level	Date Tested	Highest Level Allowed (AL)	Ideal Goal	Units	Major Source of Contaminant
Copper	0.10	0	07/28/16	AL=1.3	0	ppm	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives.
Lead	2	0	07/27/16	AL=15	0	ppb	Corrosion of household plumbing systems; erosions of natural deposits.

Substance	Highest Level Detected	Range	Date Tested	Highest Level Allowed (MCL)	Ideal Goal (MCLG)	Units	Major Source of Contaminant
Fluoride	0.89	0.48 - 0.89	01/08/18	4	4	ppm	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories.
Haloacetic Acids	29.23		12/03/18	60	0	ppb	By-product of drinking water chlorination.
Total Trihalomethanes	39.83		12/03/18	80	0	ppb	By-product of drinking water chlorination.

Please direct questions regarding this information to Mr. Robert Sternhagen with the B-Y Water District public water system at (605) 463-2531.

## IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

### B-Y Water District Did Not Meet Treatment Technique

Our water system recently violated a drinking water treatment technique due to the Spencer Dam Break and excessive runoff from spring storms. Although this was not an emergency, as our customers, you have a right to know what happened, what you should do, and what we did to correct this situation.

We routinely monitor your water for turbidity (cloudiness). This tells us whether we are effectively filtering the water supply. Normal turbidity levels at our plant are 0.1 turbidity units. A water sample taken 3/17/19 showed levels of 1.5 turbidity units. This was above the standard of 1 turbidity unit. When high levels of turbidity are present, there is an increased chance that the water may contain disease-causing organisms. Water samples for March showed that 10 percent of turbidity measurements were over 0.3 turbidity units - the standard is that no more than 5 percent of samples may exceed 0.3 turbidity units per month. These turbidity levels are relatively low. However, their presence was a concern which has been addressed.

#### What should I do?

- There is nothing you need to do. You do **not** need to boil your water or take other actions. We do not know of any contamination, and none of our testing has shown disease-causing organisms in the drinking water.
- If you have a severely compromised immune system, have an infant, are pregnant, or are elderly, you may be at increased risk and should seek advice from your health care providers about drinking this water. General guidelines on ways to lessen the risk of infection by microbes are available from EPA's Safe Drinking Water Hotline at 1-800-426-4791.

#### What does this mean?

This was not an emergency. If it had been, you would have been notified within 24 hours. *\*Turbidity has no health effects. However, turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites which can cause symptoms such as nausea, cramps, diarrhea, and associated headaches. \*These symptoms are not caused only by organisms in drinking water.* If you experience any of these symptoms and they persist, you may want to seek medical advice.

#### What was done?

Upon detection of elevated turbidity levels water production was reduced and ultimately ceased. New alternative chemical applications were made and chlorine levels were increased to alleviate any disinfection concerns. Turbidity levels decreased immediately upon the application of the alternative chemicals and were below the 1 turbidity unit in short order. Levels were below .3 turbidity units within 24 hours and returned to normal .1 levels in 30 hours of operation. No further action was required.

For more information, please contact B-Y Water District at (605) 463-2531 or B-Y Water District, PO Box 248, Tabor, SD 57063.

*\*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail. \**

This notice is being sent to you by B-Y Water District. State Water System ID#: SD4600865.

Date distributed: 4/1/2019.
